Raport Laboratorium 1

Wykonał Filip Katulski

1. Poprawa Algorytmu i corner_b

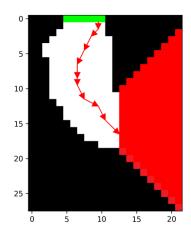

Poprawiony kod został załączony w oddzielnym pliku.

Wynik penalties dla 30k kroków i domyślnych ustawień:

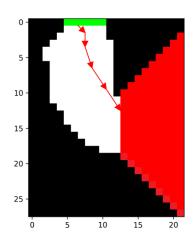

Wyniki dla 3 ciekawych kroków z końcówki symulacji:

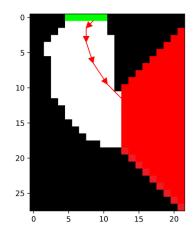

Krok 29650:

Krok 29800:

Krok 29950:

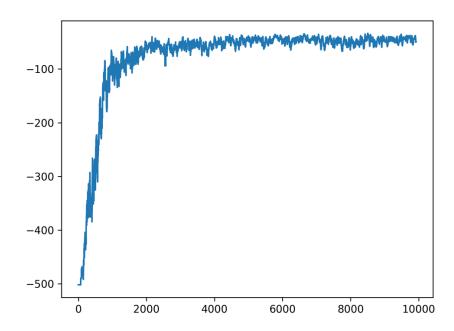

2. Grid search parametru Alfa i ilości kroków:

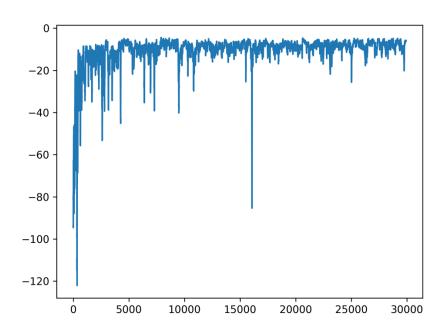

W celu optymalizacji procesu, a przede wszystkimc oszczędności czasu wykonywania zadania zdecydowałem się na przekrój niektórych parametrów parametru Alfa i N dla 10tys. kroków: **0.2, 0.3, 0.4, 0.5, 0.6, 0.8, 1.0**

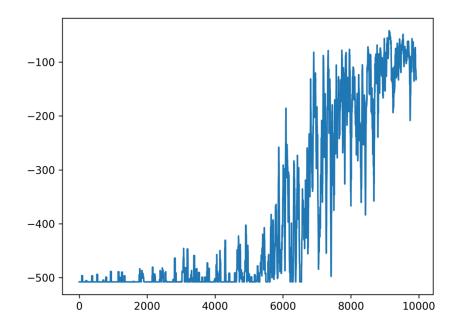

Po wyznaczeniu optymalnej wartości został uruchomiony skrypt dla większej liczby powtórzeń dla mapki corners_d.

Uwaga: Niestety dla ilości kroków większych lub równych 16 czas obliczeń rósł do kilku godzin dla 10tys. kroków, z powodu tego ograniczenia ograniczyłem się do wartości N = 2, 5, 8.

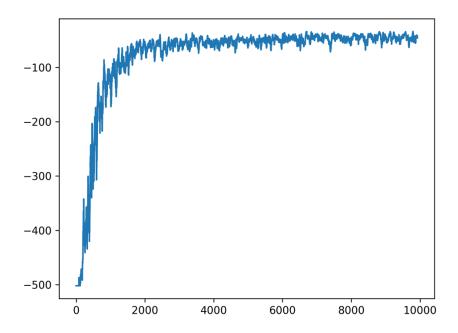

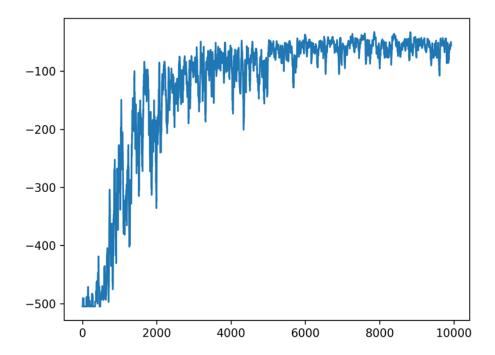

N= 5

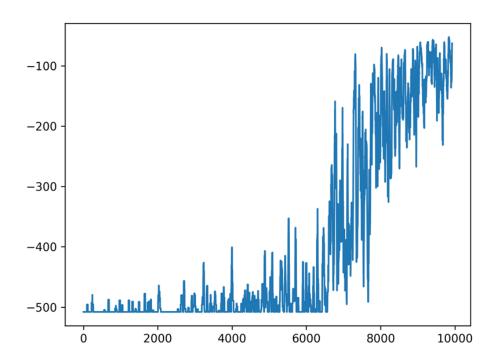

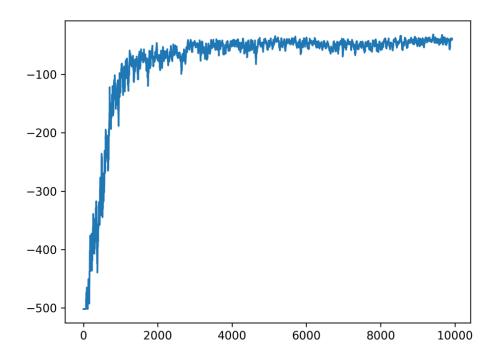

2. Alfa = 0.3

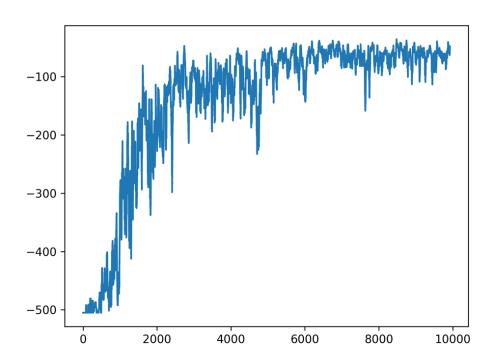

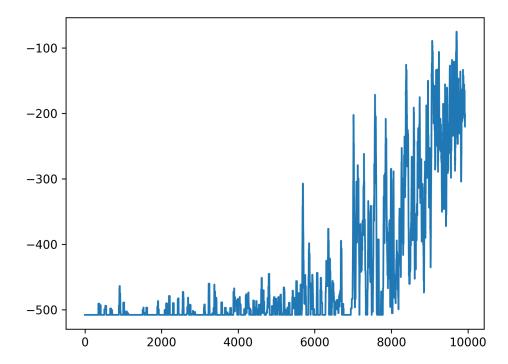

N = 8

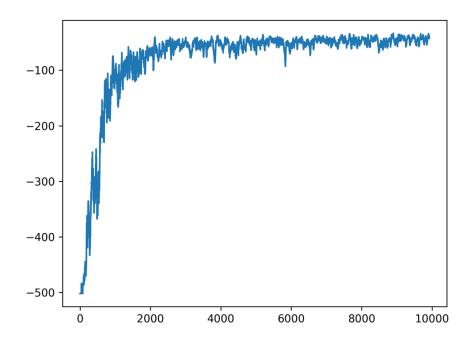

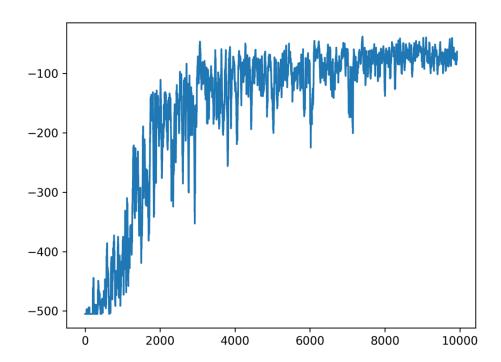

N = 5

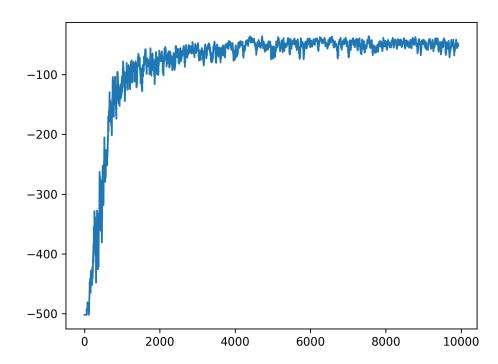

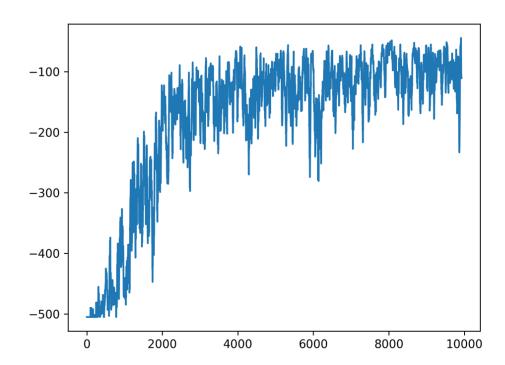

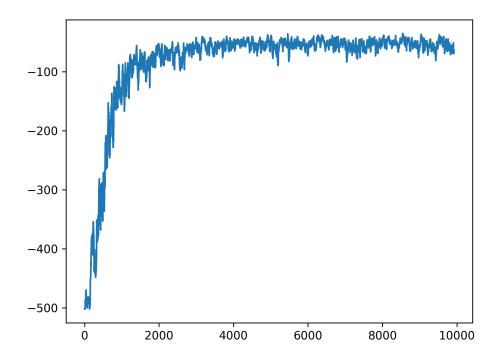

N = 5

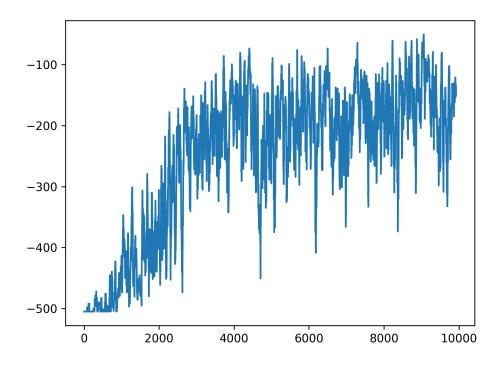

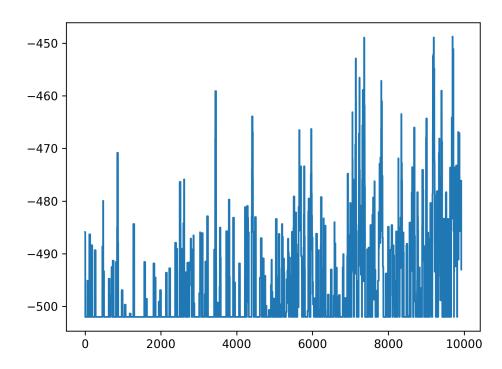

N = 5

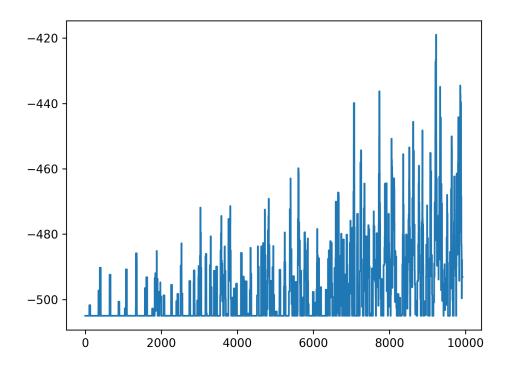

N = 5

N = 5

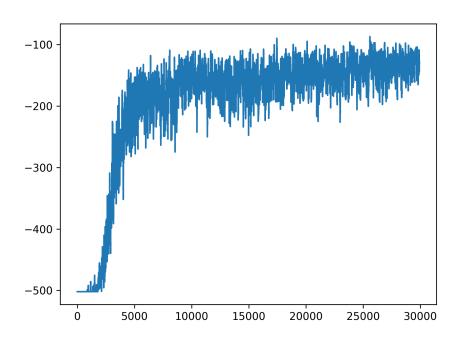

3. Corner_d z wybranymi parametrami Alfa i ilości kroków

Odrzucając najmniej obiecujące wyniki zdecydowałem się na selekcję zestawu:

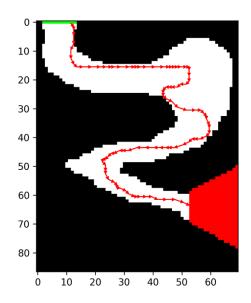

1. Alfa =
$$0.6$$
, N = 2

Wykres kar:

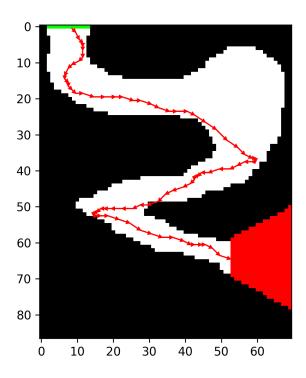

Wybrane pomyślne trasy przejazdu:

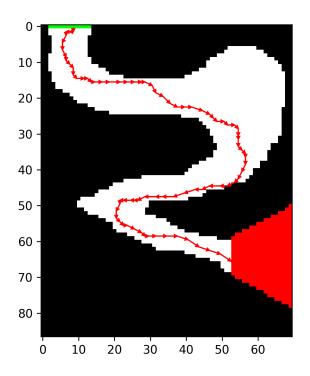

Track 29750:

Track 20750:

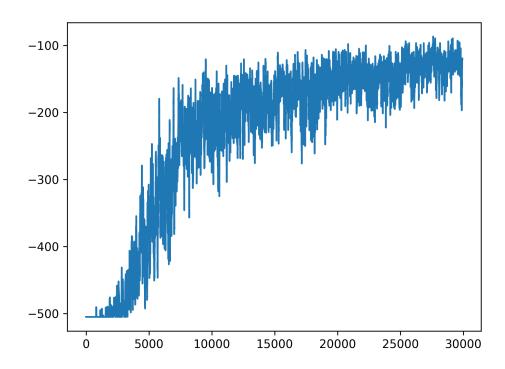

Track 29950:

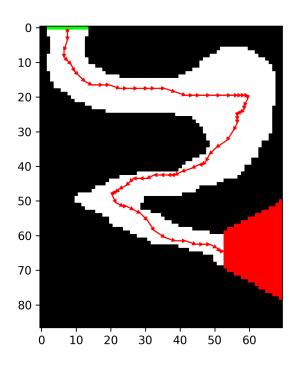

2. Alfa = 0.2, N = 5
